Combination L^m

Vary the closures. Add the internals. Customise the unit. **L^m** Lateral Filing System

All shapes and sizes

The advent of sophisticated technology which allows us to electronically scan and store files and documents has enabled many businesses to be paper less, but there are professions who will never be paper free and there is still demand for traditional storage solutions

Triumph, one of the UK's most recognised names in the furniture and storage equipment business has been manufacturing a range of steel furniture for over six decades, the company manufactures mainly to accommodate A4 files but according to Tony Hendrick, Director of Sales and Marketing the firm has maintained the sizing of its units to accommodate traditional paper sizing used by professionals including legal folio and foolscap.

"Some European made units are shallow in depth and don't allow for larger files - but as a British manufacturer we have addressed this. What we have also done is to adopt a cupboard thin profile where the outer casing of our units is thinner than normal, which allows us to maximise internal capacity. When you are looking at businesses where a lot of files need to be kept on site and where they have a significant number of cupboards to house them, even the smallest reduction in the structure can make a huge difference. The usable space has been maximised and, with the majority of projects we also offer a choice of opening and sizing so that all types of files can be absorbed."

Case study

Herbert Smith - an award-winning law firm opted for Bisley's storage to meet its expansion needs for additional office space in the City of London.

Storage was considered crucial to the overall fit-out, because records management was so vital for day to day working. The key requirements were solutions for personal storage at each workstation, general filing in the open plan areas, high density archives to cope with the volume of work and, one manufacturer to supply a complete solution.

Bisley LateralFile was selected as the core element for both personal and general office storage. Bisley InnerSpace, a high density mobile storage system specifically designed for the front office was selected to provide archive storage. Though high density, the design and positioning of InnerSpace enabled ready access to all files and maintained the aesthetic of the office design.
